

## 3.2 - Windows Security Baseline

---

Implementieren Sie eine umfassende Security-Konfiguration von Windows Server mithilfe der aktuellen Security Baseline. Dieser Satz an Group Policy Rules kann mithilfe des Microsoft Security Compliance Toolkits konfiguriert und angewendet werden.

Ich habe den DC1-1 aus B1 verwendet (Es wird ein NAT Adapter für Downloads benötigt)

### Tools downloaden

Microsoft Security Compliance Toolkit auf dem Server downloaden:

<https://www.microsoft.com/en-us/download/details.aspx?id=553194>

folgende Tools auswählen und entzippen:

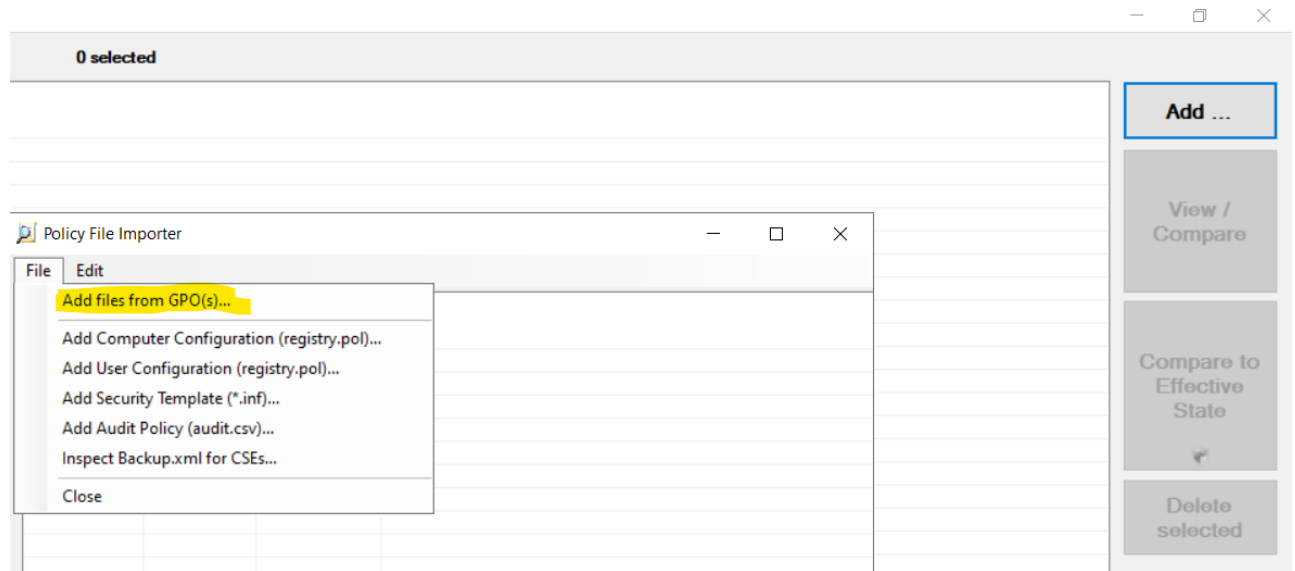

|                                                                               |          |
|-------------------------------------------------------------------------------|----------|
| <input checked="" type="checkbox"/> PolicyAnalyzer.zip                        | 1.5 MB   |
| <input checked="" type="checkbox"/> LGPO.zip                                  | 519.2 KB |
| <input checked="" type="checkbox"/> Windows Server 2022 Security Baseline.zip | 1.3 MB   |

### Baseline im AD Anwenden

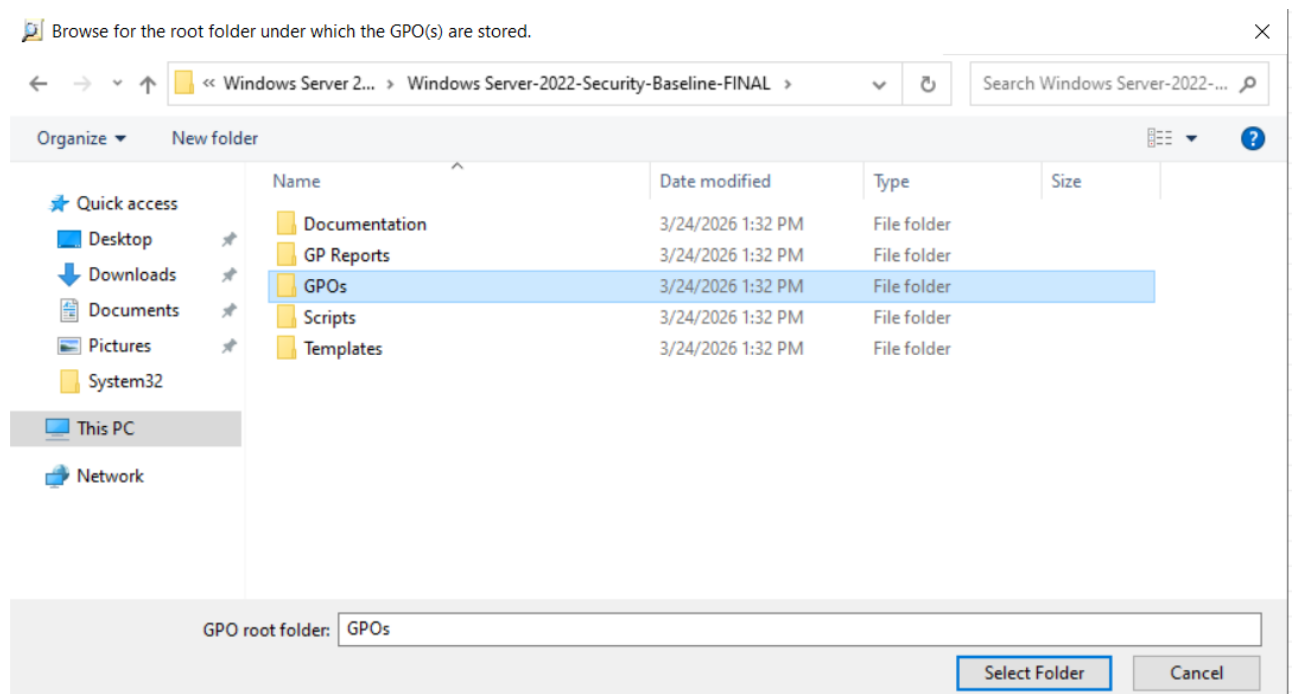

- Kopieren des gesamten Inhaltes des Ordners **Windows Server-2022-Security-Baseline\templates** in den policy definitions Store: **C:\Windows\SYSTEM32\sysvol\<domain-name>\Policies\PolicyDefinitions**
- Gruppenrichtlinienverwaltung öffnen (gpmc.msc)
- Neue leere GPO namens Windows Security Baseline erstellen -> rechtsklick Import Settings -> Ordner Windows Server-2022-Security-Baseline\GPOs auswählen -> GPO auswählen (in diesem Fall MSFT Windows Server 2022 -Domain Controller)
- GPO aktivieren ( Details -> Objektstatus -> Aktiviert)
- GPO mit OU (hier Domain Controllers)verknüpfen per drag and drop GPO auf OU ziehen

### Überprüfung

- Policy Analyzer starten (PolicyAnalyzer.exe)
- "ADD" die "Windows Security Baseline" GPO's einfügen ->

dann:

die GPOS sollten aufgezählt werden. Das GPO Set (die liste der GPOs in diesem Fall die Baselines) im vorgeschlagenen ordner abspeichern. Falls sie an einem bestimmten ort abgespeichert werden sollen muss dieser ort ganz unten in der software ausgewählt werden:

**Policy Path:**  
Advanced Audit Policy Configuration  
System Audit Policies\Account Logon  
Credential Validation  
  
Credential Validation  
  
This policy setting allows you to audit events generated by validation tests on user account logon credentials.  
  
Events in this subcategory occur only on the computer that is authoritative for those credentials. For domain accounts, the domain controller is authoritative. For local accounts, the local computer is authoritative.  
  
Volume: High on domain controllers.  
  
Default on Client editions: No Auditing.  
  
Default on Server editions: Success.  
  
**EffectiveState\_WIN-6DDNHHOAED\_20260324-143834:**  
**Option:** Failure

hier werden konflikte mit "CONFLICT" gehighlighted. alles was grau makiert ist heisst dass Werte unterschiedlich sind in den jeweiligen policies.
